History:

59-year-old female with history of hypothyroidism, insomnia, anxiety presenting for medication review and refills. Patient takes 25 mg of trazodone for sleep nightly, hopes to wean off this. Feels her mood overall is stable on current medication regimen.

Of note, patient had a hospitalization in April 2024 for bilateral frontoparietal craniotomies for chronic subdural hematomas. This was found on MRI of brain following a head trauma 2 months prior. Patient had been having extreme headaches and dizziness. During this time patient was also placed on Keppra for seizure prophylaxis as well as amlodipine for high blood pressure, she is off both of these now. Patient has residual hand weakness and continues to work with occupational therapy. She is back to regular exercise however still cannot hold weights or hold a tennis racquet due to her weakness.

Dr. Alexander Neurological Associates.
